Computer hardware and software are two essential components of a computer system. Without one or the other, a computer system would not be able to function properly.

## What is a Computer?

A computer is a machine that can be programmed to carry out sequences of arithmetic or logical operations automatically. Modern digital electronic computers can perform generic sets of operations known as programs. These programs enable computers to perform a wide range of tasks

Computer hardware refers to the physical components of a computer system. These include:

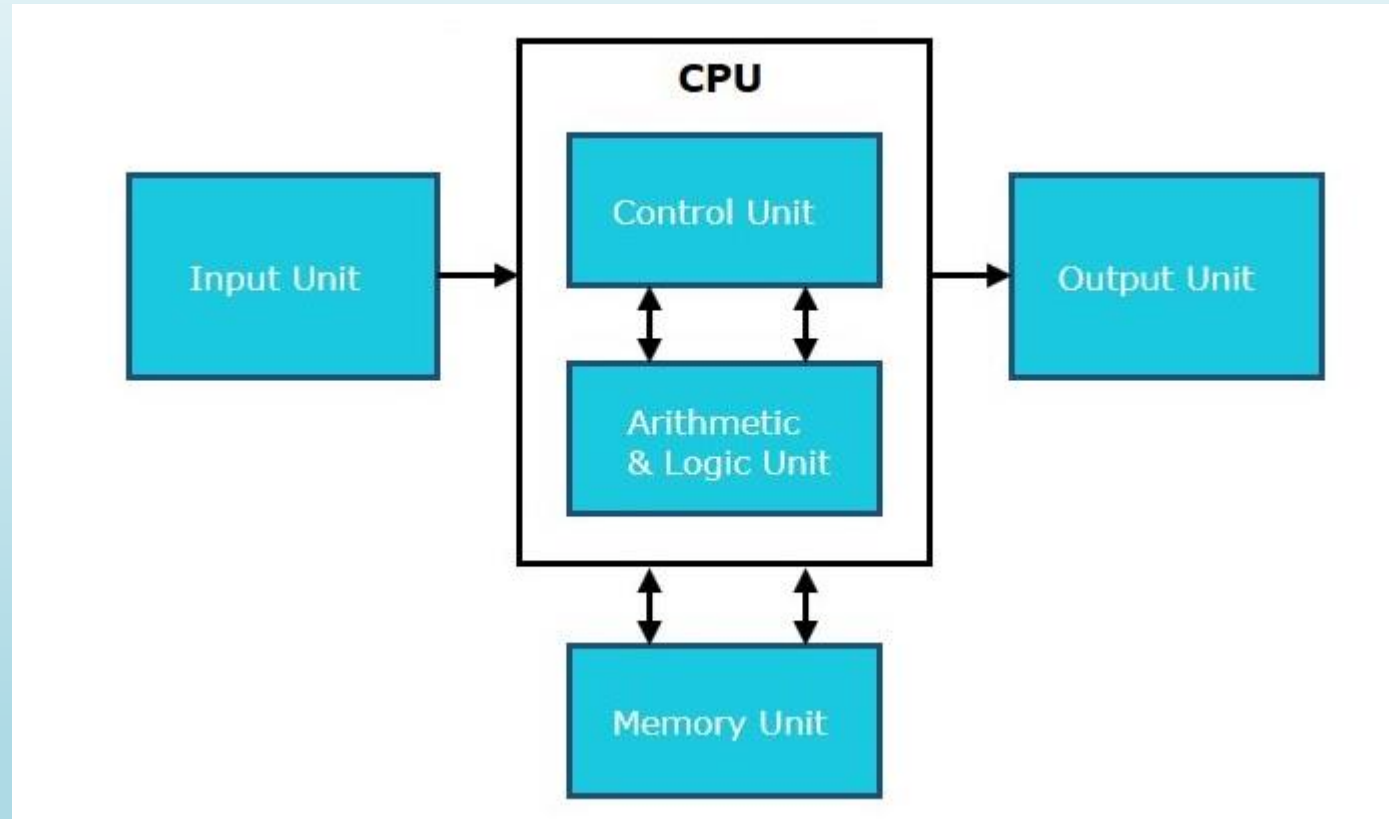

## **Central Processing Unit (CPU)**

The CPU is the "brain" of the computer. It performs all the processing and computation in a computer system.

# RANDOM ACCESS MEMORY (RAM)

Memory, also known as RAM (Random Access Memory), is used to temporarily store data that the CPU is currently using. The more memory a computer has, the faster it can perform tasks.

Laptop and Desktop ram side by side

# STORAGE

Storage is used to permanently store data on a computer system. There are two types of storage: hard disk drives (HDDs) and solid-state drives (SSDs). The industry standard in 2023 are Nvme SSDs (NVM Express or Non-Volatile Memory Host Controller Interface Specification)

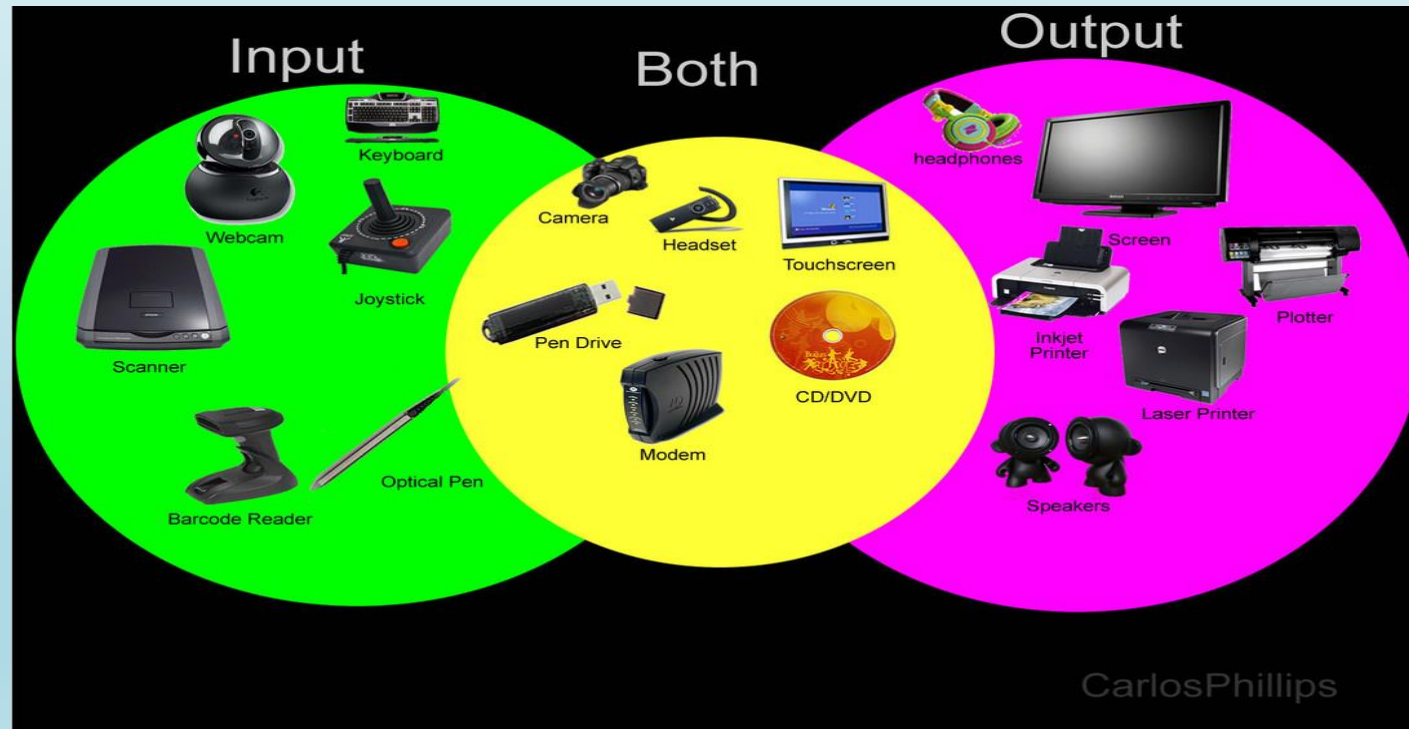

# Input/Output (I/O) Devices

I/O devices include peripherals such as keyboards, mice, monitors, and printers. They are used to input data into a computer system or display output from a computer system.

**Computer software** refers to the programs and instructions that run on a computer system. There are two types of computer software:

## **System Software**

System software is the software that runs a computer system. This includes the operating system (e.g., Windows, macOS, Linux) and device drivers.

## **Application Software**

Application software is the software that is used to perform specific tasks on a computer system. Examples of application software include word processors, spreadsheets, and web browsers.

## ***Examples of System & Application Software***

# SYSTEM SOFTWARE

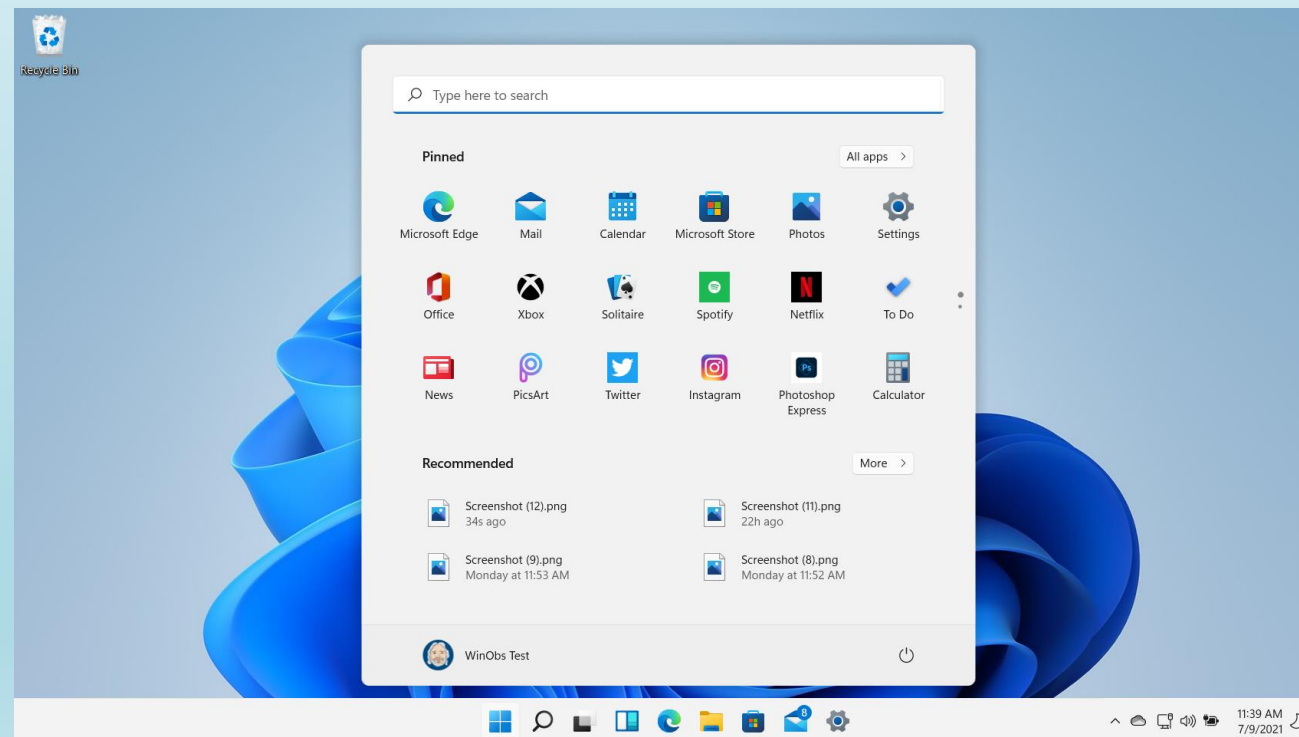

The three most common operating systems for personal computers are **Microsoft Windows**, **macOS**, and **Linux**. Modern operating systems use a graphical user interface, or GUI (pronounced gooey)

# SYSTEM SOFTWARE

Windows is an operating system designed by Microsoft. The operating system is what allows you to use a computer. Windows comes preloaded on most new personal computers (PCs), which helps to make it the most popular operating system in the world.

# SYSTEM SOFTWARE

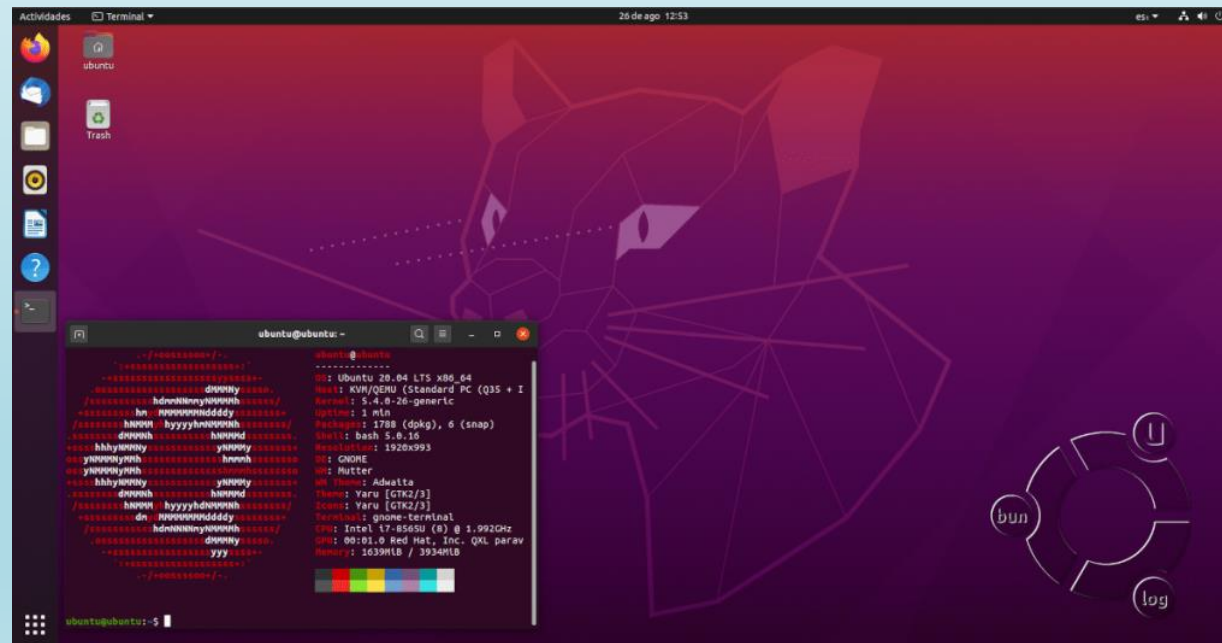

**macOS** is the operating system that powers every Mac. It lets you do things you simply can't do with other computers. That's because it's designed specifically for the hardware it runs on — and vice versa. macOS comes with an entire suite of beautifully designed apps.

# SYSTEM SOFTWARE

**Linux®** is an open source operating system (OS). An operating system is the software that directly manages a system's hardware and resources, like CPU, memory, and storage. The OS sits between applications and hardware and makes the connections between all of your software and the physical resources that do the work

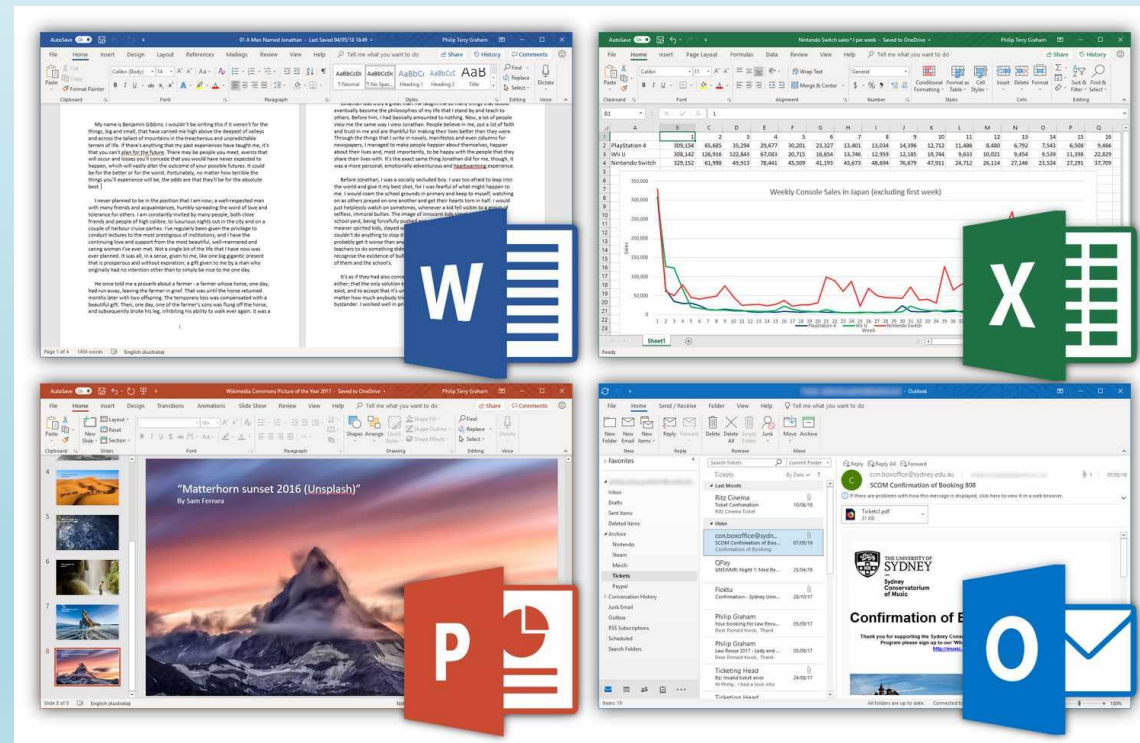

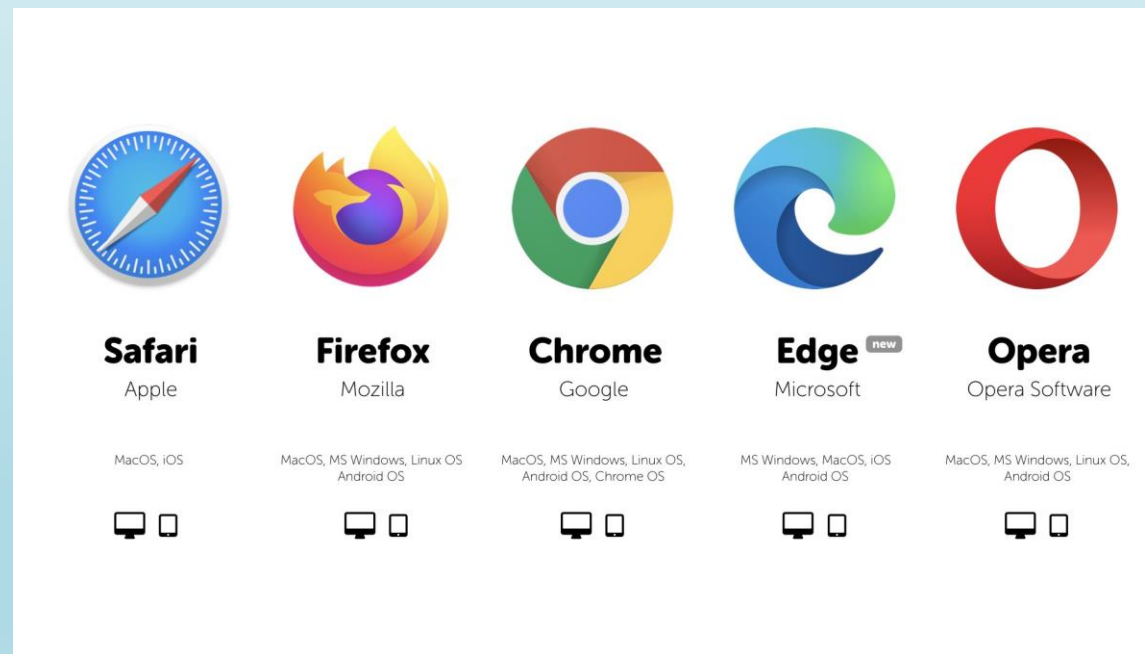

# APPLICATION SOFTWARE

**Microsoft Office** is a suite of applications designed to help with productivity and completing common tasks on a computer. You can create and edit documents containing text and images, work with data in spreadsheets and databases, and create presentations and posters

A **web browser** takes you anywhere on the internet. It retrieves information from other parts of the web and displays it on your desktop or mobile device. The information is transferred using the Hypertext Transfer Protocol, which defines how text, images and video are transmitted on the web.

# APPLICATION SOFTWARE

An **antivirus** product is a program designed to detect and remove viruses and other kinds of malicious software from your computer or laptop. Malicious software - known as malware - is code that can harm your computers and laptops, and the data on them.

# BUILDING A COMPUTER

# LAPTOPS

A laptop computer or notebook computer, also known as a laptop or notebook for short, is a small, portable personal computer.

# RECOMMENDATIONS

Recommendations for entry level laptops and desktops in 2023:

Minimum:

CPU: Intel i-3 or Ryzen 3 Processor

RAM: 8gb DDR4 RAM

Storage: 256gb or higher Nvme SSD

# CONCLUSION

## Conclusion

In summary, computer hardware and software are two essential components of a computer system. Hardware refers to the physical components of a computer system, while software refers to the programs and instructions that run on a computer system. Understanding these components is the first step in becoming proficient with computer technology.
